Description	<p>Most plastics we use today continue to be made from fossil fuels in a process that contributes to increased greenhouse gas emissions from their production, their use, through to their disposal. Recycling rates also remain low and plastics continue to pose a threat to our environment, through littering, improper waste management, and the wear and tear of products contributing to microplastic contamination in the environment. Plastics, including their chemical additives, can stay in nature for many years and potentially enter the food chain. In the wake of growing public demand, a number of manufacturers have introduced plastics that are considered bio-based, compostable or biodegradable. However, the market share for these types of plastics is only about 1 %.</p> <p>Biodegradable and compostable plastics are supposed to reduce the pollution problem posed by plastics, however, they still need to be correctly disposed of, an important point often not well understood by consumers, the EEA briefing says. For example,</p>
